The temperature test is sometimes used to determine the efficiency of these holders. When this method of testing is employed it is the practice to fill the holders with water in the same manner as with the color test. The temperature of the water as it leaves the heater is then suddenly raised 50 to 100, and the time at which the rise takes place is noted. A careful watch is then kept at the outlet of the holder to determine when any rise in temperature occurs at this point. The elapsed time indicates the time of holding. The temperature, instead of being raised, may be lowered a given amount at the heater, and the corresponding drop in temperature...
